The Series 265ER PRECISOR® II Electro-Pneumatic Positioner is used for rotary operation of pneumatic rotary valve actuators by means of electrical controller or control systems with an analog output signal of 4 to 20 mA or split ranges.

FEATURES
- There is no resonance in the range of 5 to 200 Hz.
- Perform 1/2 Split Control without any other substitutes.
- Easy to adjust zero and span.
- Easy to convert from Reverse Action to Direct Action or vice versa.
- Easy Feedback Connection.
- Fast and accurate response.
- Low air consumption.
- Easy to protect from hunting effect by using output orifice in small size of actuator.
- Designed as block build structure for maintenance and repair.

SPECIFICATIONS
- Input Signal: 4 to 20 mA DC.
- Input Impedance: 250 ±15 Ω.
- Material: Aluminum diecasting.
- Air Supply: 20 to 101 psig (1.4 to 7.0 bar).
- Air Supply Connection: 1/4˝ NPT.
- Gage Connection: 1/8˝ NPT.
- Electrical Connection: Screw terminal.
- Conduit Connection: 1/2˝ NPT female.
- Linearity: ±2% of FS.
- Hysteresis: 1% of FS.
- Sensitivity: ±0.5% of FS.
- Repeatability: ±0.5% of FS.
- Air Consumption: 0.10 scfm (3 LPM) at 20 psig (1.4 bar) supply.
- Flow Capacity: 28 scfm (80 LPM) at 20 psig (1.4 bar) supply.
- Stroke: 0 to 90°.
- Enclosure Rating: IP66.
- Operating/Ambient Temperature Limits: 265ER-XX, 265-XX-LS and 265ER-XXSS: -4 to 158°F (-20 to 70°C); 265ER-XXFM: 4 to 140°F (-20 to 60°C).
- Weight: 6.2 lb (2.8 kg).
**PRINCIPLE OF OPERATION**

Increase the input current signal to change in lift position of valve. Force exerted by (1) Torque Motor reduces Nozzle Back Pressure with increase in gap between (2) Flapper and (3) Nozzle. Then (5) Spool moves upward and the (7) Seat opens simultaneously. Air pressure of OUT1 pipe is discharged to (10) Actuator. As pressure in the actuator chamber goes up, (12) Actuator Stem starts to rotate. The movement of (12) Actuator Stem exerted force to the (a) Feedback Spring through Feedback Shaft connections. Then (10) Actuator will stop at the point of force balance exerted by the input current signal and the feedback spring.

**BLOCK DIAGRAM OF 265ER**

**INSTALLATION**

Example of attaching to actuator

**INSTALLATION cont.**

Cam Attaching Procedure

Use the DA face of cam to turn the actuator main shaft clockwise (viewed from the positioner front cover side) at the time of input feedback shaft. Use the RA face to turn it counter-clockwise (reverse action). Correctly attach the cam to the flange part of feedback shaft. Attach the cam in the procedure of loosening the hexagonal nut with flange first, setting the using actuator to the starting position and then setting the cam reference line and the bearing contact point of span adjusting arm unit to the matching position. Do not apply the supply pressure when attaching the cam as otherwise it is very dangerous. When the positioner is shipped out of our plant, the cam is tentatively tightened to the shaft. Be sure to firmly lock the cam to the lock nut [tightening torque 17.7 to 22.1 in-lbs (2.0 to 2.5 Nm)].

**ATTACHING PROCEDURE OF OPENING DEGREE INDICATION PLATE**

Lock the cam and then adjust the zero point and span. Then fix the opening degree indication plate to the shaft using the M3 screw provided. At the time, set the opening degree indication plate to the state of attaching reference line.
AIR PIPING CONNECTION
Fully purge the pipe to remove foreign matter. Use a clean supply air fully removed of humidity and dust. Use a Series AFR filter regulator to keep supply air pressure constant. When using the double acting type as the single acting type, blind either OUT1 or OUT2 and also remove the pressure gauge to close its connection.

ELECTRICAL WIRING
Connect the (+) and (-) output terminals from the regulator with the (+) and (-) input terminals, respectively, of the positioner.
- Use Cable Gland in pressure tight packing type. (Cable O.D. = 0.375”).
- Use 1/2” NPT standard for conduit thread connection type. There is a spare bolt in the terminal board.

ADJUSTMENT
Check the following prior to starting the adjustment:
• The pipeline is correctly connected with the pressure supply port and OUT1 and OUT2 port.
• The wires are correctly connected with the (+), (-) and grounding terminals.
• The actuator and positioner are sturdily connected.
• For locking of the auto/manual changeover screw of pilot valve (fully tightened in the clockwise direction).
• The span adjusting lever of internal feedback lever is attached to the correct (Direct or Reverse) position.
• For correct use of the cam face (Direct or Reverse) and that flange nut is firmly locked.

Zero Adjustment
Set input signal to the Stroke starting signal (4 mA) then turn the Zero Adjuster clockwise or counterclockwise. In case of Spring Actuator, check if it is set to standard pressure in Zero Point. If not, repeat Zero adjustment.

Span Adjustment
Adjust Range Adjustment so that an Actuator stops at 0% position of the Stroke by the 0% applied input signal and 100% position for 100% input signal respectively. Check Zero Point and repeat Zero Span Adjustment. 1/2 Split Range can be used by Zero and Span Adjustment. After setting, tighten up Lock Screw of Span adjustment.

Auto/Manual Switch
This is a Switch for changing Auto and Manual. Shipped products are set for Auto. To use Manual operation, turn A/M Switch counterclockwise. In manual operation, the pressure of an AFR regulator connects to Actuator. After using, return switch to “A”. Not available for Single Acting - OUT2 and Double Acting.

Seat Adjuster
No need to adjust in the field because Seat Adjuster is to be adjusted before shipment for balanced pressure point of output pressure. Seat Adjuster is always used for Double-acting. If the balanced pressure point of output pressure needs to be changed, use Seat Adjuster. If the sensitivity is poor because of the actuator type of load condition, turn the seat adjuster screw clockwise. If hunting occurs, turn the seat adjuster screw counterclockwise. (The amount of turning varies by actuators. Do not loosen the stopper screw at this time since it is set to avoid the screw coming.)
MAINTENANCE
If the supply air is fouled, the positioner may not operate normally. Periodically check the compressed air cleaning system and make sure that clean air is always supplied. When disassembling the pilot valve, coat grease to the O-ring of the sliding section. When the fixed orifice is clogged with carbon particles or others, remove the pilot valve Auto/Manual changeover screw (built-in fixed aperture) and clean it by inserting a 32 AWG wire into the aperture. If it must be replaced with new one, stop the supply pressure and remove the stopper screw of the pilot valve. Check the positioner once a year. Treatment at an early stage is especially important if the positioner is used in severe environments, like coastal area. In the unlikely event the 265ER Series Positioner should fail, the unit can be returned to the factory for warranty repair if the warranty period has not expired. Contact our customer service department for a RGA number and to setup the return.

CAUTION AND HANDLING
Do not apply large vibration or impact to the positioner. The positioner must be handled very carefully during transportation and operation. If the positioner is used at temperatures outside of the specification, the sealing materials deteriorate quickly and also the positioner may not operate normally. Do not remove the terminal cover at a dangerous position during power conduction. Be sure that the terminal cover and body cover are installed during the operation. If you leave the positioner at the operation site for a long time without using it, put the cover on it so that rain water does not enter the positioner. If the atmosphere is of high temperature or high humidity, take measures to avoid condensation inside. The condensation control measures must be taken thoroughly for export shipment.

TROUBLESHOOTING
